Project-1

Implementation of HTTP Client and Server:

We have implemented the HTTP client and server in java using socket programming. GET and PUT methods are implemented in this project.

GET Method: In this method, client requests data from server. Steps involved GET method are described below:

- 1) Client establishes a TCP connection with the server.
- 2) Then, client will send the name of the file it wants to server in the form of request.
- 3) After getting the request from the client, server check whether the file is present or not.
- 4) If the requested file is not present, server will send the error code 400
- 5) If the file is present, it will send the file with status 200.

PUT Method: In this method, client is sending files to the server and the server saves the file. Following steps are used in the PUT method:

- 1) Client establishes a TCP connection with the server.
- 2) If the file is present in the client side, client will send the file along with the request.
- 3) After receiving the request from the client, server saves the file and sends 200 status message.

Implementation Using Java

We have created two files in java

- 1) **MyClient.java**-> Performs the functions of a HTTP Client.
- 2) **MyServer.java**-> Performs the functions of a HTTP Server.

The server is multithreaded to handle multiple client connections at a time.

HTTP Client Implementation:

- 1) We have created a java file named "MyClient.java"
- 2) We are taking the parameters as command line arguments in the following format:

`MyClient Hostname Port Method filename`
- 3) Program will check whether the arguments are correct and if the arguments are wrong it will throw error
- 4) Client will open a socket to connect to the server.
- 5) If the method is GET, we will use PrintStream to send the request to the server.
- 6) The response coming for the server is received by using DataInputStream.
- 7) In the case of PUT method, request is send by using PrintStream and FileInputStream.
- 8) The response coming from the server is handled by the DataInputStream.

HTTP Server Implementation

- 1) Server code is written in the file named "MyServer.java"
- 2) Start Server by using the following command
`MyServer Port.`
- 3) Create ServerSocket and wait for the clients to connect.
- 4) For each client, create a separate thread to handle the connection.
- 5) Request coming from each client is handled by using DataInputStream Class
- 6) After getting the request, server perform the tasks based on the method type.
- 7) If it is a GET request, server searches for the requested file and sends 404 status if the file is not found. If the file exists, it sends status 200 and data by using PrintStream class.
- 8) If it is a PUT request, server writes the contents to a file by using FileOutputStream class.
- 9) If the file is successfully created, server sends status 200 by using PrintStream class.
- 10) addShutdown () method is used to close the server.

Execution Results

- 1) Compile both server and client by using the following commands
`javac MyServer.java`
`javac MyCleint.java`
- 2) Start the server by using the command `java MyServer 8070`

```
C:\Windows\system32\cmd.exe - java MyServer 8070

C:\Users\febin\Desktop\CCN_Project1_800961027>javac MyServer.java

C:\Users\febin\Desktop\CCN_Project1_800961027>java MyServer 8070
!!!!!!!!!!!!!!Server is Ready!!!!
```

- 3) Create a GET request to the server to read the contents of the text file data.txt
java MyClient localhost 8070 GET data.txt

```
C:\Windows\system32\cmd.exe - java MyServer 8070
C:\Users\febin\Desktop\CCN_Project1_800961027>javac MyServer.java
C:\Users\febin\Desktop\CCN_Project1_800961027>java MyServer 8070
!!!!!!!!!!!!!!Server is Ready!!!!
New Connection created: /127.0.0.1:55437
Connection: /127.0.0.1:55437 Closed
New Connection created: /127.0.0.1:55438
Connection: /127.0.0.1:55438 Closed
New Connection created: /127.0.0.1:55439
Connection: /127.0.0.1:55439 Closed
New Connection created: /127.0.0.1:55440
Connection: /127.0.0.1:55440 Closed

C:\Windows\system32\cmd.exe
C:\Users\febin\Desktop\CCN_Project1_800961027>java MyClient localhost 8070 GET data.txt
Connecting to: localhost on port 8070
GET data.txt HTTP/1.1
Host: localhost

Response from the server:
HTTP/1.1 200 OK
Date: Thu Feb 09 23:37:23 EST 2017

!!!!Testing Request!!!
!!!!HI Everyone!!!!
How are you??

C:\Users\febin\Desktop\CCN_Project1_800961027>
```

- 4) Sending a put request to the server to send an image to the server.
Java MyClient localhost 8070 put image1.jpg

```
C:\Users\febin\Desktop\CCN_Project1_800961027>java MyClient localhost 8070 put image1.jpg
Connecting to: localhost on port 8070
Response from the Server :
HTTP/1.1 200 OK File Created Successfully
Date: Thu Feb 09 23:38:27 EST 2017
```

Sending another image to the server.

Java MyClient localhost 8070 put image2.png

```
C:\Users\febin\Desktop\CCN_Project1_800961027>java MyClient localhost 8070 put image2.png
Connecting to: localhost on port 8070
Response from the Server :
HTTP/1.1 200 OK File Created Successfully
Date: Thu Feb 09 23:39:10 EST 2017
```

5) Server is shut down by using (ctrl-c) command from the prompt

```
C:\Users\febin\Desktop\CCN_Project1_800961027>java MyServer 8070
!!!!!!!!!!!!!!Server is Ready!!!!
New Connection created: /127.0.0.1:55437
